Generative AI Landscape

Generative AI applications as the UI layer and “little brain” that sits on top of the “big brain” that is the large general-purpose model layers

Application Layer: Text/Natural Language

Marketing / Content

Knowledge Management

Conversational AI (Sales/Support)

Writing

Employee Analysis + Coaching

Conversational AI

Summary

Notes / Transcription

Plagiarism

Math Doubtsolving

Learning Support

Application Layer: Everything Else

Voice / Speech

Coding

Gaming

Music

Workflow

Video

- Truly disruptive technology companies are the pairing of novel tech with unique market conditions.
Technology alone isn't sufficient - will need incredible marketing, beatable competitors and the right team. AI startups will have to ask **if their breakthrough is defensible and revolutionary enough** that it will justify replacing existing workflows
- These **tools will only cement the market positions of existing companies**. Easier for Tableau to put in a text prompt box or for Unity to incorporate AI-enabled tools than for an ML startup to build an entire visualization suite or gaming engine
 - Currently, generative AI companies primarily **exist as plugins in existing software ecosystems**: code completions happen in your IDE (GitHub Copilot); image generations happen in Figma or Photoshop;
- Disruption will happen in 2 broad categories
 - **(1) Creation**: Making stuff from scratch that acts as complete replacements of products that previously would've required human input
 - **(2) Collaboration**: Humans are paired with an AI tool to dramatically improve and speed up their work flows
 - **99% of the disruption will actually be on the collaboration side**. The image creation demos are flashy but limited/"one-and-done". **Automating away rote, low-value work is where the majority of productivity gains** will come from.
- The **"content treadmill" will be de-risked** significantly, freeing up developers and human capital for higher ROI activities
- These tools will **end up being more disruptive for individual workers than large companies**. **New innovations enforce the power law**. Top performers will no longer require support staff, they can just AI away the easy stuff. 10x engineers -> 15x engineers

"Creation Goes to Zero"
